

What is stress?

Stress is often described as a feeling of being overloaded, wound-up tight, tense and worried. We all experience stress at times. It can sometimes help to motivate us to get a task finished, or perform well. But stress can also be harmful if we become over-stressed and it interferes with our ability to get on with our normal life for too long.

What are the symptoms of stress?

When we are faced with a stressful event, our bodies respond by activating the nervous system and releasing hormones such as adrenalin and cortisol. These hormones cause physical changes in the body which help us to react quickly and effectively to get through the stressful situation. This is sometimes called the 'fight or flight' response. The hormones increase our heart rate, breathing, blood pressure, metabolism and muscle tension. Our pupils dilate and our perspiration rate increases. Whilst these physical changes help us to try to meet the challenges of the stressful situation, if the stress is ongoing and the physical changes don't settle down, they can then cause other physical or psychological symptoms.

These symptoms can include:

- Headaches, other aches and pains
- Sleep disturbance, insomnia
- High blood pressure
- Upset stomach, indigestion, diarrhoea
- Weakened immune system
- Heart disease
- Anxiety
- Anger, irritability
- Depression
- Fatigue
- Feeling overwhelmed and out of control
- Feeling moody, tearful
- Difficulty concentrating
- Low self-esteem, lack of confidence

Types of stress

▶ ACUTE STRESS

Sometimes stress can be brief, and specific to the demands and pressures of a particular situation such as a deadline, or a performance, or facing up to a difficult challenge or traumatic event. This type of stress often gets called acute stress.

▶ EPISODIC ACUTE STRESS

Some people seem to experience acute stress over and over. This is sometimes referred to as episodic acute stress. These kind of repetitive stress episodes may be due to a series of very real stressful challenges, for example, losing a job, then developing health problems, followed by difficulties for a child in the school setting. This kind of stress may also occur due to a person's tendency to be a bit like a 'stress machine'. These people tend to worry endlessly about bad things that could happen, are frequently in a rush and impatient with too many demands on their time, and everything appears urgent. For some people, episodic acute stress is a combination of real challenges and a tendency to operate like a 'stress machine'.

▶ CHRONIC STRESS

The third type of stress is called chronic stress. This involves ongoing demands, pressures and worries that seem to go on forever, with little hope of letting up. Chronic stress is very harmful to people's health and happiness. Even though people can sometimes get used to chronic stress and not notice it so much, it continues to wear people down and has a negative effect on their relationships and health.

When to seek professional help

If high levels of stress continue for a long period of time, and are interfering with you enjoying a healthy life, it is worth seeking professional help. A mental health professional, like a psychologist, can help you identify behaviours and situations that might be contributing to consistently high stress levels, and help you to make changes to the things that are within your control. Seeking help can be one way to manage your stress effectively.

Tips on how to manage everyday stress

Learning to handle stress in healthy ways is very important. Fortunately, it is also easy to learn simple techniques, including recognising and changing the behaviours that contribute to stress, as well as techniques for reducing stress once it has occurred. The APS offers the following tips that can help you look after your mind and body and reduce stress and its impact on your health.

► IDENTIFY WARNING SIGNS

It is very helpful to be able to identify early warning signs in your body that tell you when you are getting stressed. These vary from person to person, but might include things like tensing your jaw, grinding your teeth, getting headaches, or feeling irritable and short tempered.

► IDENTIFY TRIGGERS

Often there are known triggers which raise our stress levels and make it more difficult for us to manage. If you know what the likely triggers are, you can often anticipate them and practise calming yourself down beforehand, or even find ways of removing the trigger. Triggers might include late nights, deadlines, seeing particular people, hunger or over-tired children.

► ESTABLISH ROUTINES

Having predictable rhythms and routines in your day, or over a week, can be very calming and reassuring, and can help you to manage your stress.

Routines can include:

- Regular times for exercise and relaxation
- Regular meal times, waking and bedtimes
- Planning ahead to do routine jobs on particular days of the week

► SPEND TIME WITH PEOPLE WHO CARE

Spending time with people you care about, and who care about you, is an important part of managing and ongoing stress in your life.

- Spend time with friends and family, especially those who you find uplifting rather than people who place demands on you
- Share your thoughts and feelings with others when opportunities arise. Don't 'bottle up' your feelings.

► LOOK AFTER YOUR HEALTH

- Make sure you are eating healthy food and getting regular exercise
- Take time to do activities you find calming or uplifting such as listening to music, walking or dancing
- Avoid using alcohol, tobacco or other drugs to cope

► NOTICE YOUR SELF-TALK

Sometimes when we are stressed we say things in our head, over and over, that just add to our stress. This unhelpful self-talk might include things like: 'I can't cope', or 'I'm too busy', or 'I'm so tired' or 'it's not fair'. Whilst we might think that these are fairly truthful descriptions of what's going on, they are not always helpful to think over and over, and can even make you feel worse.

- Notice when you are using unhelpful self-talk, and instead try saying soothing, calming things to yourself to reduce your levels of stress. Try more helpful self-talk like 'I'm coping well given what's on my plate', or 'Calm down', or 'Breathe easy'.
- Keeping things in perspective is also an important strategy. When we are stressed, it's easy to see things as worse than they really are. Try self-talk such as 'This is not the end of the world' or 'In the overall scheme of things, this doesn't matter so much'.

► PRACTISE RELAXATION

Make time to practise relaxation. This will help your body and nervous system to settle and readjust. Consider trying some of the following things:

- Learn a formal technique such as progressive muscle relaxation, meditation or yoga
- Make time to absorb yourself in a relaxing activity such as gardening or listening to music
- Plan things to do each day that you look forward to and which give you a sense of pleasure, like reading a book

To talk to an APS psychologist, speak to your GP about a referral or contact the APS Find a Psychologist service by calling **1800 333 497** or visiting the website **www.findapsychologist.org.au**
